

CLA Website Architecture OS v1

Section 2 — Component Architecture

STATUS: APPROVED

Purpose

This section defines how reusable UI components are organized, built, documented, versioned, and maintained throughout the CLA website.

Every component should be easy to understand, reuse, maintain, and improve.

Component Naming

Components use descriptive names.

Examples:

- * HeroSection
- * PrimaryButton
- * EventCard
- * SermonCard
- * PrayerRequestForm

Generic names should be avoided.

Component Organization

Each component has its own folder.

Example:

```
components/  
  HeroSection/  
  PrimaryButton/  
  EventCard/
```

Component Structure

Each component folder contains:

- * README.md
- * component.html
- * component.css

- * component.js
- * preview.png (optional)
- * variants/ (optional)

Testing may be added in future versions but is not required for Version 1.

Versioning

Reusable components support versioning.

Examples:

- * Hero v1
- * Hero v2
- * Hero v3

New versions should improve the component while preserving project history.

Deprecated Components

Deprecated components are moved into an /archive folder.

They should not be permanently deleted unless the Project Owner approves.

Documentation

Every component includes concise documentation.

Documentation includes:

- * Purpose
- * Usage
- * Variants (if applicable)
- * Dependencies (if applicable)
- * Notes (only when necessary)

Documentation should remain short, practical, and non-redundant.

Component Independence

Components should remain as independent as possible.

Dependencies should be minimized to improve portability and maintenance.

Configuration

Components should support configuration instead of duplication whenever practical.

Reusable options are preferred over creating multiple nearly identical components.

Theming

Components support theming.

Examples include:

- * Light
 - * Dark
 - * Ministry accent colors
 - * Seasonal themes
-

Shared Components

Updating a shared component should automatically update every page that uses it.

Independent copies should be avoided whenever practical.

Guiding Principle

Build once. Reuse everywhere. Improve intentionally.
