

STATUS: APPROVED

Purpose

This section defines the performance standards for the CLA website.

Performance is considered a core feature of the website and should be preserved throughout every stage of development.

Performance Philosophy

Every design and development decision should balance:

- * User Experience
- * Accessibility
- * Visual Quality
- * Performance

Performance should never be sacrificed without meaningful justification.

Loading Speed

Pages should load as quickly as practical.

Large assets, unnecessary scripts, excessive animations, and redundant code should be avoided.

CSS Performance

Stylesheets should remain:

- * Organized
- * Modular
- * Maintainable
- * Optimized

Unused styles should be removed whenever practical.

JavaScript Performance

JavaScript should remain lightweight and modular.

Scripts should only load when required.

Unused JavaScript should be avoided.

Image Performance

Images should be:

- * Optimized
- * Properly sized
- * Responsive
- * Compressed without noticeable quality loss

Lazy loading should be used whenever appropriate.

Video Performance

Videos should never negatively impact initial page loading.

Large videos should use efficient delivery methods and should not autoplay with sound.

Font Performance

Only required font files should be loaded.

Unnecessary font weights and duplicate font resources should be avoided.

Animation Performance

Animations should remain smooth and efficient.

Motion should use performant properties whenever possible.

Animations should never reduce usability or responsiveness.

Network Requests

The number of unnecessary network requests should be minimized.

Reusable assets and shared resources should be leveraged whenever practical.

Third-Party Resources

Third-party scripts, libraries, and services should only be included when they provide meaningful value.

Every external dependency should be reviewed for:

- * Performance
- * Security
- * Reliability
- * Long-term maintenance

Performance Testing

Performance should be verified before every major release.

Testing should include:

- * Desktop
- * Tablet
- * Mobile

Performance regressions should be resolved before deployment whenever practical.

Future Optimization

Every six months the Project Owner should review:

- * New browser capabilities
- * Modern optimization techniques
- * Updated image formats
- * New web standards
- * Opportunities to improve loading speed

Performance improvements should evolve alongside the website.

Guiding Principle

A premium website should feel fast, responsive, and effortless on every device.
