

Section 9 — Deployment & Release Architecture

STATUS: APPROVED

Purpose

This section defines how the CLA website is built, reviewed, tested, deployed, and maintained throughout its lifecycle.

The objective is to ensure every release is stable, predictable, and aligned with the CLA Design Language.

Deployment Philosophy

Every deployment should improve the website.

Releases should never introduce unfinished work or reduce the overall quality of the user experience.

Source of Truth

The GitHub repository serves as the single source of truth for the project.

All production releases originate from the approved repository.

Version Control

Every significant change should be committed with a clear and descriptive commit message.

Project history should remain readable and organized.

Release Process

Every release should follow this sequence:

1. Development
2. Review
3. Testing
4. Approval
5. Deployment
6. Verification

Production deployments should never skip the review process.

Approval

The Project Owner has final approval before major releases are deployed.

Minor maintenance updates may follow an approved maintenance workflow.

Production Stability

The production website should always remain functional.

Experimental features should not be deployed until they meet the CLA quality standards.

Rollback Strategy

Every deployment should allow recovery to the previous stable version if necessary.

Rollback procedures should remain simple, documented, and reliable.

Monitoring

After deployment, verify:

- * Website availability
- * Navigation
- * Forms
- * Performance
- * Responsive layouts
- * Media
- * Console errors

Any critical issues should be resolved immediately.

Documentation

Major releases should include documentation describing:

- * New features
- * Improvements
- * Bug fixes
- * Breaking changes (if any)

Project documentation should remain current.

Long-Term Maintenance

The website should receive regular maintenance, including:

- * Dependency updates
- * Security updates
- * Performance improvements
- * Accessibility improvements
- * Browser compatibility updates

Maintenance should preserve the CLA identity while improving long-term reliability.

Future Reviews

Deployment procedures should be reviewed during each six-month architecture review.

The workflow may evolve as development tools improve, provided reliability and quality remain the priority.

Guiding Principle

Every release should leave the CLA website better than it was before.
